Binomische Formel und Klammern auflösen

a) 
$$(10x + 5y)^2 + (7y - 3x)^2$$
  
=  $(10x + 5y)(10x + 5y) + (7y - 3x)(7y - 3x)$ 

1. Potentan Owsrechnen

= (10x + 5y)(10x + 5y) + (7y - 3x)(7y - 3x)  $= (00x^{2} + 90xy + 50xy + 25y^{2} + 49y^{2} - 21xy - 21xy + 9x^{2}$   $= 100x^{2} + 100xy + 25y^{2} + 49y^{2} - 42xy + 9x^{2}$ 

b) 
$$(4x + 5)^2 - 4x^2$$
  
=  $16x^2 + 40x + 25 - 4x^2$   
=  $12x^2 + 40x + 25$ 

 $= 109x^2 + 58xy + 74y^2$ 

c) 
$$(2x+1)(3x-4) - (5x+3)(2x+5)$$
  
=  $(6x^2-5x-4) - (10x^2+25x+6x+15)$ 

$$= (6x^2 - 5x - 4) - (10x^2 + 31x + 15)$$

$$= (6x^{2} - 5x - 4) + (-1) \cdot (10x^{2} + 31x + 15)$$

$$= (6x^{2} - 5x - 4) - 10x^{2} - 31x - 15$$

$$= -4x^{2} - 36x - 19$$

d) 
$$12x^{2} + 3x (7x - 3)^{2}$$
  
=  $12x^{2} + 3x (49x^{2} - 42x + 9)$ 

$$= 12x^2 + 147x^3 - 126x^2 + 27x$$

$$= 147x^3 - 1/4x^2 + 27x$$

$$f(x) = 120x^{2} - 3x^{2}$$
